Mid-term Feedback

Chen Sun

One area that I am doing well is that I relate the course with real applications. This is based on the result "The course material is relevant to my future work as an engineer". Though the course I am teaching is a theoretical course, I try my best to relate the knowledge students learned in class with what is really used and how it is used in industry. As I have some working experience in industry, I am very glad to share my experience of applying this kind of knowledge. Meanwhile, I look up materials of applications.

One are I would like to approve is the pace of this course. This is based on the result of "The pace of the class is appropriate for my learning". I make students realize this course is very important, and I see them working really hard. But I may go over too many knowledge points in each class, and some students are left behind.

Overall, I realize my teaching styles really influence students' learning. I plan to talk with some students after class about my teaching styles, about how to design homework, and about the pace of classes. I also decide to give them more chance to ask questions, based on the result of question "I am able to ask questions during class in order to clarify understanding of concepts or problems".
